Wire Up the iOS Client

Back in the iOS app, you need to tell Hotwire Native where this configuration lives.

Path configuration should be set up before we create our `Navigator` in `SceneDelegate`. A great place for this, and any future configuration, is in `AppDelegate`. Open that file and delete code until you are left with the following.

ch03_05/ios/HikingJournal/AppDelegate.swift

```
import UIKit

@main
class AppDelegate: UIResponder, UIApplicationDelegate {
    func application(
        _ application: UIApplication,
        didFinishLaunchingWithOptions launchOptions:
        [UIApplication.LaunchOptionsKey: Any]?
    ) -> Bool {
        return true
    }
}
```

This function, `application(_:didFinishLaunchingWithOptions:)`, is the first thing that's called when our app launches, even before `SceneDelegate` is created.

SceneDelegate vs. AppDelegate

Multiple instances of the same iOS app can be run on devices with larger screens, like iPads. `AppDelegate` manages the global application and state whereas `SceneDelegate` manages each instance, or scene.

Our app will always assume a single scene. So we'll always have a single instance of `SceneDelegate` (and `AppDelegate`).
