```
}
```

`/configurations/ios_v1.json` is appended to the app's homepage to create the route. See the `.server()` option? This tells Hotwire Native to fetch this JSON from a remote endpoint, parse the file, and apply the rules when the app is launched.

Run the app and create a new hike. Clicking the New button presents the hike form in a modal.

Seeing the new hike form in this way helps break down the flow of the app and sends the user on a little side quest. Submitting a valid form dismisses the modal and pushes a new screen.
