done somewhere else. That “somewhere else” is likely not idempotent. While no system can be completely idempotent, critical parts of it can be, and Sidekiq jobs are one such part.

Back to `CompleteOrderJob`, it’s clearly not idempotent. One reason is the one you just experienced, where the entire job was retried, even though part of it was successful before the first failure. We can address this issue by breaking up the job into smaller jobs that only retry the specific part that failed.
