

A diagram showing a check against the email service for matching emails, then an optional area where an email is sent if no matches were found. After that, the email ID is saved and the `RequestOrderFulfillmentJob` is queued.

The fake email service provides a way to search by email address and email template ID. You'll have to look through the returned array of emails for the order ID in the email metadata. Here's what that looks like in the `send_notification_email` method of `OrderCreator`:

snapshots/3-3/sidekiq-book/app/services/order_creator.rb

```
  end
end
def send_notification_email(order)
» potential_matching_emails = email.search_emails(
»   order.email,
»   CONFIRMATION_EMAIL_TEMPLATE_ID
» )
» email_response = potential_matching_emails.detect { |email|
»   email.template_data["order_id"] == order.id
» }
» if email_response.nil?
»   email_response = send_email(order)
» end
  order.update!(email_id: email_response.email_id)
  RequestOrderFulfillmentJob.perform_async(order.id)
end
```
