Chapter 10
Rising Tsunami

Amidst the borders of the vast Taklamakan Desert in Sinkiang, north of the Siachen Glacier, lies an unlikely green oasis, and nestled within this oasis is a newly built manufacturing facility that is going to alter the dimensions of the geostrategic equations between the US, China and India. This factory is soon going to become one of the world's largest plants to manufacture polysilicon, a substance that is an intermediate product in the manufacturing process of silicon wafers that are then transformed into an innumerable range of microchips for multiple applications.

The world is powered by microchips that run everything from pacemakers to mobile phones to geostationary satellites. There is an emerging cold war between the US and China which is going to rapidly divide the world between those that have access to advanced microchip technology and those that do not. The US is positioning itself to weaponise the innovation, technology and intellectual property ecosystem in microchips, just as the Chinese have leveraged their size and economic assistance for the Belt and Road Initiative. The US is now telling its friends to stop using Chinese giant Huawei's telecom products that use microchips made by its subsidiaries.

China's Card Is Revealed
