trade. India has not exercised its might yet, but it is now time to do so. It is also time to use Japanese and South Korean money and expertise to rapidly set up hydropower projects on the Jhelum and Indus to fully exploit our legal share of these waters.

India's Options

In the ultimate analysis, India has to choose sides in the coming microchip technology cold war. It has to cut itself loose from the age-old policy of appeasing China and boldly join the US-led alliance in this war. Choosing to sit on the fence will cut India off from technological power and deny it a place at the high table in the comity of nations like Japan, South Korea and the EU that are on US's side in the coming cold war. It is inevitable that the Chinese are going to construct a series of microchip manufacturing hubs in Gilgit-Baltistan. They will be fed with intermediate raw materials from the GCL-Poly Energy Holdings Kashgar plant. GCL-Poly is controlled by the Zhu Gongshan family and the Poly Group of China.[57] The Poly Group is a state-owned Chinese business group, one among the 102 central state-owned Enterprises under the Supervision of State-owned Assets Supervision and Administration Commission of the State Council. In other words, it is a Chinese Government corporation. Zhu Gongshan is an elusive Chinese billionaire extremely close to Xi Jinping.[58] The Zhu Gongshan family is also married into the Deng Xiaoping family. [59] If the Government of India is unaware of these facts, then it has only itself to blame. The Indian partners of GCL-Poly are the Adani Group and the Essel Group.
