

Cylindrical Projection

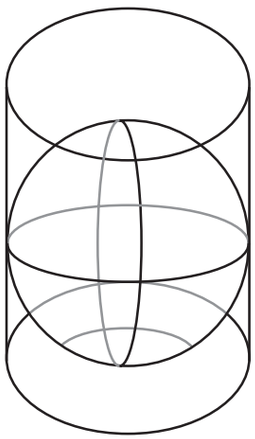

Classification based on Developable Surface used

The three basic projections are based on the types of developable surface. They are:

1 Cylindrical Projection

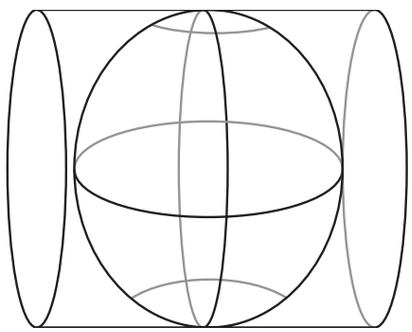

- It can be visualized as a cylinder wrapped around the globe.
- The longitudes (meridians) and latitudes (parallels) appear as straight lines.
- Length of equator on the cylinder is equal to the length of the equator, therefore, it is suitable for showing equatorial regions.

Normal: when a cylinder has line of tangency to the equator. It includes Equirectangular Projection, the Mercator projection, Lambert's Cylindrical Equal Area, Gall's Stereographic Cylindrical, and Miller cylindrical projection.

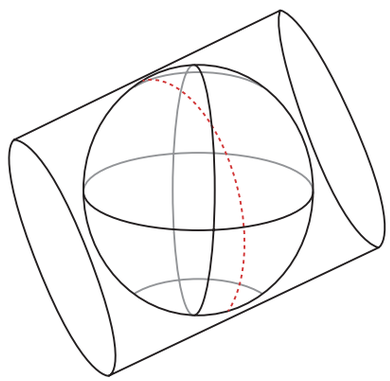

(a) Normal

Transverse: when cylinder has line of tangency to the meridian. It includes the Cassini Projection, Transverse Mercator, Transverse cylindrical Equal Area Projection, and Modified Transverse Mercator.

b) Transverse

Oblique: when cylinder has line of tangency to another point on the globe. It only consists of the Oblique Mercator projection.

(c) Oblique
