Example 10.1

Construct a cylindrical equal area projection for the whole globe with a reduced earth radius of 2 cm and the latitudinal and longitudinal interval 30°.

Construction:

- Draw a circle of 2 cm radiuswith O as centre.
- Draw the equator (WE) and the Polar N-S axis.
- Mark the angles of 30°, 60° for both the hemispheres. And label it as B, C, B' and C' respectively.
- Extend the line WE to E'
- Divide the line EE' into to 12 equal parts (360/30) with the distance of EB. This line represents the Equator.
- Through each point draw perpendiculars which represent the longitudes
- Draw parallel lines at N, C, B, B', C' and S equal to EE' to represent 30°, 60° and 90° latitudes for both the hemispheres. Complete the projection as shown in Figure.

Cylindrical Equal Area Projection
