```
:info => {
:nickname => "hafizbadrie"
}
}
end

describe "GET #provider" do
it "sign up with twitter success" do
user = User.new
get :twitter
response.should redirect_to new_user_registration_url
end

it "twitter sign in success" do
user = FactoryGirl.create(:user)
get :twitter
response.should redirect_to root_path
end
end
end
```

The previous code gives you two cases. The first case shows that the user should be redirected to the registration page because the incoming user is a new user. The second case uses the data defined in our factory to sign in and then the user should be redirected to the root path defined in the route. Please remember that to run the test perfectly, you have to create a dummy value for `omniauth.auth`, which is used by the `process_omniauth`. In the previous code, the dummy value is defined in the `before(:each) ... do` block of code, which is executed in every test case.

Now, let's see the result of the test. Please execute `rspec spec/controllers` and the result will be as follows:

```
bash-3.2$ rspec spec/controllers/
..

Finished in 0.11569 seconds
2 examples, 0 failures

Randomized with seed 62083

bash-3.2$
```
