```
class Class
  def attr_checked(attribute, &validation)
    define_method "#{attribute}=" do |value|
      raise 'Invalid attribute' unless validation.call(value)
      instance_variable_set("@#{attribute}", value)
    end

    define_method attribute do
      instance_variable_get "@#{attribute}"
    end
  end
end
```

This code defines a *Class Macro (117)* named attr_checked. This Class Macro is an instance method of Class, so it's available to all classes. The final step in your development plan asks you to restrict access to attr_checked: it should be available only to those classes that include a module named CheckedAttributes. The test suite for this step is pretty much the same one you used in step 4, with a single additional line:

ctwc/checked_attributes/module.rb

```
require 'test/unit'

class Person
➤  include CheckedAttributes

  attr_checked :age do |v|
    v >= 18
  end
end

class TestCheckedAttributes < Test::Unit::TestCase
  def setup
    @bob = Person.new
  end

  def test_accepts_valid_values
    @bob.age = 18
    assert_equal 18, @bob.age
  end

  def test_refuses_invalid_values
    assert_raises RuntimeError, 'Invalid attribute' do
      @bob.age = 17
    end
  end
end
```
