Context Probe

Execute a block to access information in an object's context.

```
class C
  def initialize
    @x = "a private instance variable"
  end
end

obj = C.new
obj.instance_eval { @x } # => "a private instance variable"
```

For more information, see page 85.

Deferred Evaluation

Store a piece of code and its context in a proc or lambda for evaluation later.

```
class C
  def store(&block)
    @my_code_capsule = block
  end

  def execute
    @my_code_capsule.call
  end
end

obj = C.new
obj.store { $X = 1 }
$X = 0

obj.execute
$X # => 1
```

For more information, see page 89.

Dynamic Dispatch

Decide which method to call at runtime.

```
method_to_call = :reverse
obj = "abc"

obj.send(method_to_call) # => "cba"
```

For more information, see page 49.
