Kernel Method

Define a method in module Kernel to make the method available to all objects.

```
module Kernel
  def a_method
    "a kernel method"
  end
end

a_method # => "a kernel method"
```

For more information, see page 32.

Lazy Instance Variable

Wait until the first access to initialize an instance variable.

```
class C
  def attribute
    @attribute = @attribute || "some value"
  end
end

obj = C.new
obj.attribute # => "some value"
```

For more information, see page 221.

Mimic Method

Disguise a method as another language construct.

```
def BaseClass(name)
  name == "string" ? String : Object
end

class C < BaseClass "string"  # a method that looks like a class
  attr_accessor :an_attribute  # a method that looks like a keyword
end

obj = C.new
obj.an_attribute = 1   # a method that looks like an attribute
```

For more information, see page 218.
