Two cheek bones – Zypomatic bone – Two zygomatic bones	forms the check
Two upper jaw bones Two Maxilla bones	Forms upper jaw.
Two palatine bones	which join with the upper jaw bones forming the hard palate
Two Nasal concha	one in each side of wall of the nose
One Vomer bone	which rests on the palate and helps to form the nasal septum
One Mandible bone	It forms the lower jaw and horse shoe shaped

The vertebral column

The vertebral coloum, also known as the back bone or spine, is part of the axial skeleton. It separated by intervertebral disc.

Spine or Vertebral column is the central part of the skeleton. It supports the head and encloses the spinal cord. It consists of 33 irregular bones called "vertebrae"

The parts of the vertebral column are as follows:

- **7 Cervical vertebral column** in the neck region. The first two bones called **atlas** and **axis** are important for nodding and turning the head.
- **12 dorsal or thoracic vertebrae** at the back of the chest. The ribs are joined to these vertebrae
- **5 lumbar vertebrae** in the waist region
- **5 sacral vertebrae** are fused together to form the sacrum, a triangular shaped bone with a hollow anteriorly. The sacrum helps to form the pelvis.
- **4 small vertebrae** in the tail region are fused to form a small triangular bone called the **coccyx**. It is attached to the lower part of sacrum.

Upper limbs.

Upper limb is divided into three regions. Its consists of,

- **Arm** - located between the shoulder and elbow joint.
- **Fore arm** - between the elbow and wrist joints
- **Hand** - which is located distal to the wrist.

Chest (thorax)

The rib cage forms the thorax portion of the body. It consists of 12 pairs of ribs with their costal cartilage and the sternum. The ribs are anchored posteriorly to the 12 thoracic vertebrae. It protects the heart and lungs.

Lower limbs

Lower limb includes foot, thigh, hip and gluteal region.

Ear bones (MIS)

Following are the 3 ear bones

M-Malleus

I-Incus

S-Stapes

Together they form a short chain that crosses the middle ear and transmit vibrations caused by sound waves from the eardrum to the liquid of the inner ear.

Throat bone (Hyoid bone): is a horseshoe shaped bone situated in the anterior midline of the neck between the chin and the thyroid cartilage.

1.4 Muscular system

A brand or bundle of fibrous tissue in a human body that has the ability to contract, producing movement in or maintaining the position of parts of the body.
