Cerebrum

The cerebrum is the largest part of the brain and its lobes coordinate and enable body movement, sensory perception, learning, olfactory sense, gustatory sense, optic sense, auditory sense, memory, thinking, judgment and communication abilities.

Cerebrum

The cerebrum has four major lobes which, as shown in the picture above, are:

- The frontal lobe
- The temporal lobe
- The parietal lobe
- The occipital lobe

The frontal lobe is responsible for thinking, movement, judging and writing.

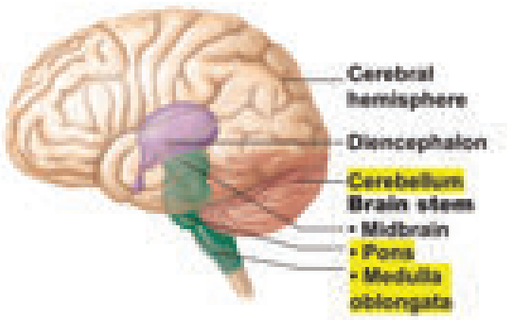

The temporal lobe plays a role in terms of memory and hearing.

The parietal lobe helps in sensory perception.

The occipital lobe facilitates understanding written language and vision.

Cerebellum

The cerebellum, referred as the little brain or hind brain is much smaller than the cerebrum and lies behind the other parts of the brain. The cerebellum controls motor nerves, balance, equilibrium, fine motor coordination and gross motor coordination.

Cerebellum

Brain stem

The brain stem lies at the base of the skull and between the right and left hemispheres of the brain.

The brain stem has three sections

- Midbrain
- Pons
- Medulla oblongata

The midbrain controls messages sent from other higher areas of the brain to the pons and medulla below it and it also controls posture.

The pons connects the midbrain and the medulla. The pons controls the rhythm of respirations.

The medulla oblongata connects the pons and the spinal cord through a hole in the base of the skull called the **foramen magnum**. The medulla is the center of control for breathing and cardiac functioning and manages swallowing, vomiting, cough, and sneeze reflexes.

The Spinal Cord

The spinal cord connects the brain to the peripheral nervous system throughout the body. The spinal cord is protected with the meninges and the spinal column.

The spinal cord is divided into different parts, which are:

- Cervical region
- Thoracic region
- Lumbar region
