- Bell's palsy.

1.6 Gastro Intestinal System

Introduction

The alimentary canal, is a continuous hollow tube from the mouth to the rectum. The alimentary canal along with the associated organs like the salivary glands, liver, pancreas and the gallbladder is called the digestive or gastrointestinal system. The primary role of the digestive system is to supply blood stream with nutrients that can be used by the body for its fuel, energy and fluid needs.

Parts of digestive system

The organs that contribute to digestion are the tongue, salivary glands, the liver, the gallbladder, and the pancreas. The gallbladder and the pancreas secrete and deposit bile and digestive enzymes, respectively through the common bile duct to the duodenum of the small intestine.

Mouth

The cheeks,tongue and palate frame the mouth, which is also called oral cavity .its boundaries are defined by the lips, cheeks, soft palate and epiglottis. It is divided in to two sections.

They are

- The vestibule- the area between the cheeks and the teeth.
- The oral cavity- filled by the tongue

The mouth is the opening through which the person ingests food and fluids. Incisors, canines, premolar and molars are the types of teeth helps in mastication

Tongue

Tongue is one among the five sensory organ. It is a muscular structure used for moving food in the mouth and to swallow fluid and food. Taste buds are found on the upper surface of the tongue and the salivary glands.

Salivary glands

Salivary glands produce saliva which contains the digestive enzyme amylase. Amylase digests and breaks down starch into glucose and maltose.

Pharynx

The pharynx receives air from the nares or the mouth and it also receives food from the mouth. When people say that their food has gone down the wrong pipe, they are experiencing an abnormal small amount of food moving from the pharynx to the trachea.

Epiglottis

The epiglottis is the flap like projection in the back of the mouth attached to the
