From the **larynx** air moves in to the **trachea** and down to the intersection that branches to form the **right** and **left primary bronchi**, each of these bronchi, branch in to **secondary bronchi** that branch into **tertiary bronchi** that branch in to smaller airways called **bronchioles** that eventually connect with tiny specialized structure called **alveoli** that function in gas exchange.

The respiratory system is divided into the upper and lower respiratory system.

Upper Respiratory Tract	Lower Respiratory Tract
Nostril	Trachea
Pharynx	Bronchi
Larynx	Bronchioles
Epiglottis	Alveoli

Nostrils

A nostril is one of the two channels of the nose from the point where they bifurcate to the external opening.

Pharynx

Pharynx is the part of the throat. It is situated at behind the nasal cavity, besides the larynx, and above the oesophagus. It has three part, they are nasopharynx, oropharynx and laryngopharynx.

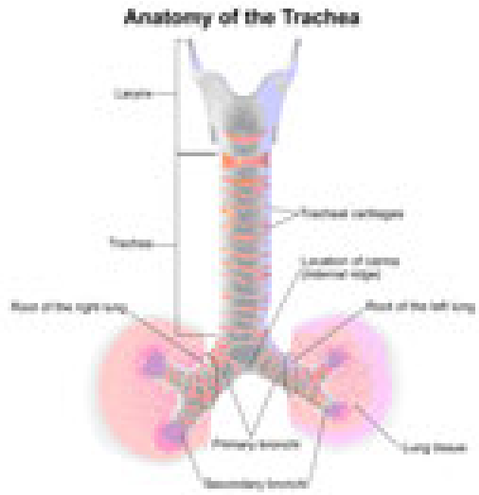

Epiglotis

Epiglotis is a flap in the throat. It is present between the pharynx and larynx. It helps to prevent the food from entering the windpipe [trachea] and the lungs. It is made up of elastic cartilage covered with a mucus membrane attached to the entrance of the larynx.

Larynx

Adam's apple or the voice box. Larynx connects the lower part of the pharynx and trachea. It received inspired air from the pharynx and passes it to the trachea.

Trachea

Trachea

Trachea called as windpipe, is a cartilaginous tube that connects the pharynx and larynx to the lungs allowing the passage of air.

Lungs

The lungs are the primary organs of the respiratory system. Human lungs are conical in shape and spongy organ. Right and left lung are situated in the thoracic cavity, either side of the heart, and above the diapharam.

The lungs are protected by ribcage and the spine. The right lung is larger than left lung. The left lung has two lobes, upper and lower lobes. The right lung has three lobes upper, middle and the lower lobe.

Bronchus

The bronchus is passage of airway in the respiratory system. They conducts air in to the lungs. It is divided in to primary, secondary, and tertiary bronchi.

Bronchioles

They are bronchus of the bronchi. The bronchioles further divided in to smaller terminal bronchioles.
