

- Identifying the assumption and formulation of Hypothesis
- Selection of research design
- Entry in to the research site (Pilot Study)
- Protect the rights of the participants
- Planning tools for data collection
- Collection of data
- Analysis of the data
- Communicating the findings

Simple Steps In Research Process

1. **Identifying the problem**: It is a clear finding of the problem that should be studied. In general broad topic area is selected and then the topic is narrowed down to a specific one. It may be from personal experiences or literature sources.

The purpose of the study: During the formulation of the problem statement the commonly used mnemonic is "SMART"

S – Specific

M – Measurable

A – Achievable

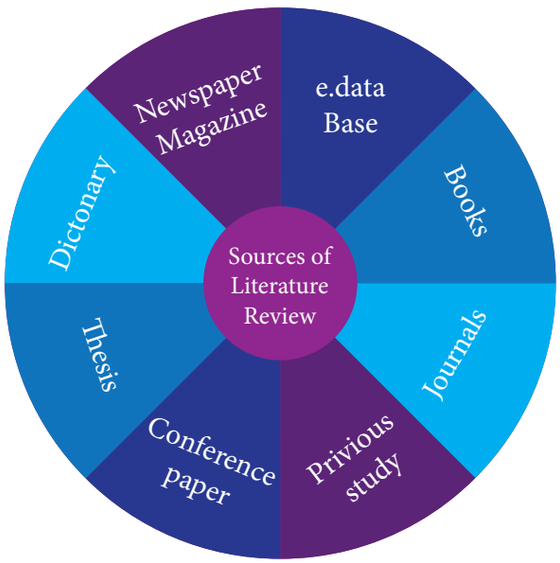

R – Relevant

T – Time Bound

This will be easy while writing objectives for the study. Objectives may be single or several.

2. **Review of literature:** It is one of the most important step in the research process. A literature review is an account of what has been already established or published on a particular research topic by various researchers.(University of Toronto 2001)

Sources of literature review

3. **Developing the a theoretical/conceptual framework :** It is the valuable part of scientific research. Which helps in the selection of the study characters and in defining them. It also directs to the prediction and the interpretation of the study findings.
4. **Identifying the study Assumptions** : Assumptions are held to be true but have not necessarily seen proven. It influences
