Epididymis

The epididymis is the connecting tube between the testes and the vas deferens which stores, transports and matures the sperm from the testes. The epididymis has three parts such as, the head, body and tail.

Vas Deferens

The vas deferens moves the mature sperm from the epididymis to the ejaculatory ducts and then to the urethra for ejaculation.

Seminal Vesicles

The seminal vesicles are the pair of glands which attach to the vas deferens near and under the bladder. It produces a fructose substance that provides the sperm with the energy it needs to locomote and move through the male reproductive tract.

Prostate

The prostate is an exocrine gland which secretes an alkaline fluid that preserves the life of the sperm when it hits the acidic female vagina.

Ejaculatory Ducts

The pair of ejaculatory ducts forms the union of the vas deferens and the seminal vesicles. Sperm enters the ejaculatory ducts from the vas deferens.

Urethra

The urethra is an organ common for both reproductive system and urinary system.

The primary male reproductive hormones are

Follicle stimulating hormone which produces sperm (spermatogenesis).

Luteinizing hormone which produces testosterone.

Testosterone which leads to the development of primary and secondary sexual characteristics during puberty.

Disease related to reproductive system

- Prostate cancer
- Testicular cancer
- Gynecomastia
- Erectile dysfunction
- Varicocele
- Hydrocele.

Sensory system

It is an organ of the body which response to external stimuli by conveying impulses through the sensory neuron to the appropriate places within the sensory nervous system.

There are five sense organs in the human body. It includes,

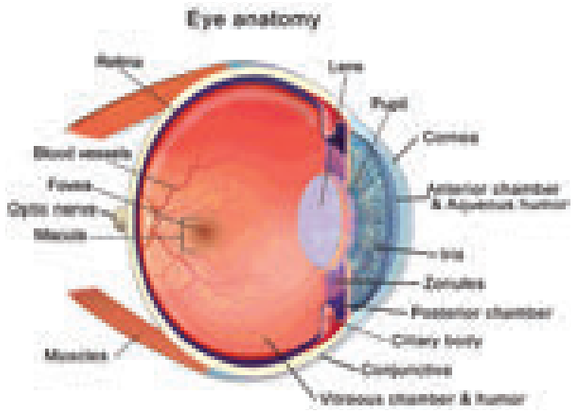

- Skin
- Eye
- Ear
- Tongue
- Nose

Skin

The human skin is the outer covering of the body and is the largest organ of the integumentary system. The main functions are protection, regulation and sensation.

Anatomy of the Eye

The eye is a sensory organ. It absorbs light rays from our environment and transforms them in such a way that the information in the brain can be processeced further.

Anatomy of Eye

- The eye has many parts work together to produce clear vision.
- The **sclera** or white part of the eye protects the eyeball.
