

Tongue

There are two groups of muscles of the tongue.

1. **Four intrinsic** - alter the shape of the tongue and not attached to the bone.
2. **Four paired extrinsic muscles**- change the position of the tongue and are anchored to the bone.

The tongue upper surface is covered by taste buds housed in numerous lingual papillae. It is responsible for taste.

Nose

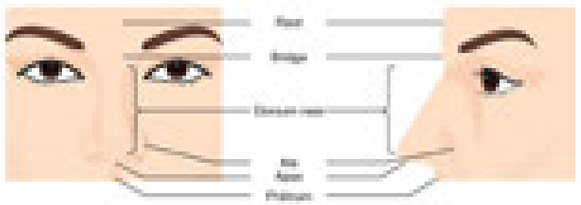

The organ of smell is located in the middle of the face. The internal part of the nose lies above the roof of the mouth.

The nose consists of external nose and nasal cavity both are divided by the septum into right and left.

Functions of the nose

- Respiration
- Olfaction

1. Nose is the first part of the upper respiratory tract.
2. Warming and moistening of the inhaled air.
3. Filter the air by removing particulates.

Nose

Olfaction

It has olfactory receptor neuron and it is responsible for sense of smell.

Speech

The normal speech is produced with pressure from the lungs, this can be modified using airflow through the nose in a process called nasalization.

SUMMARY

- ❖ Integumentary system comprises the skin. Appendages protect the body from various kinds of damage. Such as loss of water or damages from outside.
- ❖ It consists of the skin, hair, finger nails, toe nails and other structures including glands.
- ❖ Heart is the master of cardiovascular system. It pumps out blood to supply oxygen, electrolytes, nutrients and hormones through out the body.
- ❖ Blood circulation controls the body temperature, the PH or acid base balance of the body.
- ❖ Blood pumping cycle of the heart is called cardiac cycle. The heart consists of four chambers, valve, and three layers of covering.
- ❖ Heart has three types of circulation like coronary, systemic and pulmonary circulation. It is considered as a one of the vital organ of the body.
