SUMMARY (CONTD)

- The musculo skeletal system is made up of the body's bones, muscles, cartilage, tendons, ligaments, joints, and other connective tissue that supports and bind tissues and organs together.
- The primary functions of the system is forming and supporting the body, allowing motion, and protecting vital organs.
- The nervous system is the most complex of all the systems which coordinates controls and enables all body functions like movement, thinking, autonomic, or automatic, reflexes and sensory perception.
- The nervous system sends messages to all parts of the body and receives it.
- The alimentary canal, with the other organs of digestion, is a continuous hollow tube from the mouth to the rectum.
- The alimentary canal along with the associated organs like the salivary glands, liver, pancreas and the gallbladder is called the digestive or gastrointestinal system.
- The stages of digestion are mastication, digestion, and the absorption.
- Urinary system also known as the renal system, consist of kidneys, ureters, bladder, and the urethra.
- The purpose of the urinary system is to eliminate the excess water from the body, regulate blood volume and blood pressure, control and regulate the level of electrolytes and blood PH.
- The physiology of urinary system are filtration, reabsorption and secretion.
- Respiratory system provides required oxygen to the body, to sustain life and to eliminate carbon dioxide. The respiratory systems' work is associated with the heart and lungs. It is divided into upper and lower respiratory tract.
- Air is breathed in through the nose or the mouth. Alveoli plays major role in process of diffusion .
- The endocrine system provides the body with the hormones that are needed to sustain life and create life. Hypo and hyper secretion of the endocrine glands leads to physiological problems.
- The purpose of reproductive system is to procreate, and to provide sexual gratification to the person.
- Sensory organ responses to external stimuli by conveying impulses through the sensory neuron to the appropriate places within the sensory nervous system.
- The skin is the outer covering of the body and is the largest organ of the integumentary system. The main functions are protection, regulation and sensation.
- The eye is a sensory organ. It absorbs light rays from our environment and transforms them in such a way that the information in the brain can be processed further.
- The ear is the organ for hearing. The ear can be divided into outer and inner ear. Inner ear plays major role in conduction of sound waves.
- Tongue is a muscular organ situated in the floor of the mouth. It is associated with the function of taste, speech, mastication, and deglutination.
- Nose is the organ of smell located in middle of the face. The internal part of the nose lies above the roof of the mouth.
