- Stress
- Obesity
- Smoking

Signs and Symptoms

- Red, raised, inflamed patches of skin
- Whitish-silver scales or plaques on the red patches
- Dry skin that may crack and bleed
- Soreness around patches
- Itching and burning sensations around patches
- Thickened, pitted nails
- Painful, swollen and stiff joints

Diagnosis

- Nose specific blood test or diagnostic procedures
- Physical Examination
- Skin Biopsy or scraping

Management

Psoriasis has no cure. Treatments aim is

- to reduce inflammation and scales
- to slow the growth of skin cells
- to remove plaques.

Topical treatments: Creams and ointments applied directly to the skin can be helpful for reducing mild to moderate psoriasis.

- Steroid creams
- Vitamin D3 creams
- Phototherapy (ultra violet light).
- Immune system suppressing medications.
- Photo chemotherapy (PUEA).

Nursing Management

- Assist patient with daily tub bath to soften scales and plaques.
- Apply topical preparation after bath and scale removal.
- Advise patient to wear goggles during phototherapy.
- Encourage patient to follow up.
- Encourage patient to try to identify triggers.
- Teach patient to avoid direct sun exposure.
- Advice patient to use good lubricants to prevent drying and cracking of skin.

Complications

- Psoriatic arthritis
- Obesity
- Type 2 Diabetes
- Hyper tension
- Cardio Vascular disease
- Parkinson' Disease

2.2 Myocardial Infarction (MI)

A heart attack is a life-threatening condition that occurs when blood flow to the heart muscle is abruptly cut off, causing tissue damage. This is usually the result of a blockage in one or more of the coronary arteries. It occurs as a result of sustained ischemia, causing irreversible myocardial cell death (necrosis). 80% to 90% of all acute Myocardial Infarctions (MIs) are secondary to thrombus formation. Acute myocardial infarction is the medical name for a heart attack.

Definition

Myocardial infraction refers to a dynamic process by which one or more regions of the heart experience a severe and prolonged decrease in oxygen supply because of insufficient coronary blood flow, subsequently necrosis or death to the myocardial tissue occurs.

Types

1. Non-ST segment elevation myocardial infarction or heart attack (NSTEMI)
