the skin. They are found under the arms in the axillary area and perform little function in humans. Sweat glands, are exocrine glands secrete a substance that cools the body off with perspiration and eliminate wastes.

Sweat gland

Disease related to Integumentary system

- Acne
- Athlete's foot
- Sunburn
- Albinism
- Impetigo
- Rosacea
- Rash
- Pressure ulcers
- Skin cancer
- Herpes
- Psoriasis

Functions of Integumentary System

- Protects the body against the external environment as the first line of defence from germs and infections.
- The skin, its thickness and sweat glands, maintain the body temperature
- Vitamin D production
- Protection against UV rays
- Perspiration.
- Dehydration
- Reception of tactile sensory messages such as heat, cold, and pain sensations.

1.2 The Cardiovascular System

Heart is the master of the cardiovascular system. It pumps out blood all over the body to circulate and supply oxygen, electrolytes, nutrients and hormones. Blood circulation controls the body temperature, the PH or acid base balance of the body. Circulation fights against infection, helps in clotting of blood during injury and eliminates waste products such as carbon dioxide.

Position

The heart lies in the thoracic cavity at the mediastinum [the space between the lungs]. It lies obliquely a little more to the left than the right. The apex is about 9cm to the left of the midline at the level of the 5th intercostal space and the base extends to the level of the 2nd rib.

Organs associated with the heart

Inferiorly- The apex rest on the central tendon of the diaphragm .

Superiorly- The great vessels in the aorta, superior venacava, pulmonary artery and pulmonary veins.

Posteriorly- Oesophagus ,trachea, left and right bronchus, decending aorta, inferior venacava, and thoracic vertebrae.

Lateraly- The left lung overlaps the left side of the heart.

Anteriorly- The sternum, rib, and intercostal muscles.

Structure

The heart wall is composed of three layers of tissues. Namely

- Pericardium
- Myocardium
- Endocardium.

Pericardium

The pericardium is the outmost layer and is made up of two sacs. The outer sac and inner side

1. Fibrous pericardium –consists of fibrous tissue.
