of myocardium covered by endocardium. It subdivided into 4 chambers they are

- Left atrium.
- Right atrium
- Left ventricle
- Right ventricle.

Right Atrium

Right atrial chamber is located in the upper portion of the right side of the heart which receives blood from all parts of the body by superior and inferior venacava. They are thin less muscular walls and smaller than ventricles.

Left Atrium

Left atrium receives oxygenated blood from the lungs and pumps it down into the left ventricle.

The lower portion of the heart left side of is left ventricle.

Right Ventricle

Deoxygenated blood flows in the right atrium, passes through the tricuspid valve and in to the right ventricle, which pumps the blood up to the lungs by pulmonary artery, through the pulmonary valve.

Left Ventricle

It is larger and more muscular chamber. It pumps and delivers the blood to all parts of the body by a larger artery [**aorta**] for systemic circulation.

Flow Of Blood Through The Heart

- The right atrium receives deoxygenated blood from all over the body by superior and inferior venacava.
- Deoxygenated blood from right atrium passes through right atrioventricular valve to right ventricle.
- Pulmonary artery collects deoxygenated blood from right ventricle to lungs through pulmonary valve or semilunarvalve.
- Pulmonary artery is divided in to left and right carries either side of the lungs.
- In lungs exchange of gases takes place.
- Oxygenated blood passes through pulmonary veins to the left atrium.
- In left atrium blood passes through left atrioventricular valve to the left ventricles carries blood from left ventricles through aortic valves.
- Arteries-Oxygenated blood passes through all parts of the body.

Valves

These are the fibrous flaps of tissues that are present in cardiac chamber, between the arteries chambers and veins. They ensure unidirectional flow and prevent backflow of blood.

They are

Arterioventricular Valve

It is present in every ventricle and atrium.

Tricuspid Valve

The valve lies between the right ventricle and right atrium.

Mitral Valve

It is present between left atrium and left [bicuspid valve] ventricle.

Semilunar Valve

It is present between arteries and ventricles.

Aortic Valve

An aortic valve is present between the aorta and left ventricle.

Pulmonary Valve

Pulmonary valve exists between the pulmonary artery and right ventricle.

Functions of heart

The structure of the heart is primarily responsible for transportation of blood and
