Similarly, Maruti Suzuki rose to the challenge and partnered with AgVa Healthcare to produce 10,000 ventilators in a month.[14] AgVa provided the technical knowledge, whereas Maruti Suzuki used its network of suppliers in addition to its experience in scaling up production. Bharat Heavy Electricals Limited provided the electronic chips which would go into these ventilators and HP Inc partnered with Redington 3D in India to produce 1,20,000 ventilator parts which would go into these 10,000 ventilators. These were parts with complex design and a certain level of tolerance. Typically, it would have taken five months to manufacture them. But HP used its 3D printing technology to produce the same parts in less than a month.[15]

With rigorous efforts from the DRDO and the private manufacturers, the cost of the Indian manufactured ventilators went down to about ₹2–5 lakh for simple ventilators and about ₹5–8 lakh for complex ones. These were paid for by the PM CARES fund, expensing about ₹2,000 crore to make about 50,000 units which would be distributed to government-run COVID-19 centres and hospitals across states and UTs.[16] These were also fitted with geotags so that their location for transport, delivery and usage could be accurately tagged.[17] The MoHFW also created WhatsApp groups with officials from states, doctors from hospitals where they were supplied and suppliers so that issues regarding the use and maintenance of these could be raised and resolved efficiently in real time.[18]

By December 2020, in six months, from being a country which had absolutely no ventilator manufacturing and only about 16,000 units in public health facilities, 36,000 Made-in-India ventilators had been supplied to public health facilities and by May 2021, that number rose to 49,960.[19]

◆

Emboldened by these experiences, the prime minister made up his mind that across industries ecosystems could be created which could spurt manufacturing immensely. The possibilities of the kind of push these new ecosystems would give to the economy and the jobs which would be created were magnanimous. He saw vast opportunity in times of crisis, which could shoot up over the decades to come and decided that it was time for India to become atmanirbhar (self-reliant) across sectors and industries.
