World over, leaders and economists were growingly increasingly concerned over the looming economic depression. The emerging trends from the scientific community which showed that the virus would possibly stay with us for a long time were significantly concerning. The mentality in the beginning when the virus started spreading was: ‘let’s freeze in place, the virus will pass, then we will unfreeze and go back to normal’.[20] However, with no vaccine in sight and no significant proven miracle treatment, there was no chance of returning to ‘normalcy’ in the near future. The Bank of England had predicted UK’s biggest recession in 300 years and the US wasn’t far behind.[21] When the pandemic hit, the whole world suffered a supply shock: trade was disrupted, factories closed down, stores and restaurants shut and people lost their jobs. In a world so interdependent, this had brutal consequences. Several economists had begun to worry about the doom loop—a cycle of negative feedback. The cause of worry was that if people didn’t start earning again soon, the supply shock would turn into a demand shock which, in turn, would weaken supply, further increasing unemployment and diminishing demand. The doom loop. In order to break this circuit, several countries took difficult policy decisions and offered tailored stimulus packages. Normally, swings of business cycles have a direct effect on people’s ability to spend on consumer goods, their income and large personal investments. This situation was a bit different. It wasn’t that people didn’t have money to buy things or go to restaurants; many had the funds, but they couldn’t go to restaurants or malls. Businesses had shut shop to follow lockdown protocol. Airlines and shipping companies had halted operations. Circulation of containers had ceased causing a sharp crunch in their availability. Factories had closed down because of which production ceased. Entire sectors had shut, albeit temporarily, contracting the global economy.[22] As the world leaders and economists assessed the longevity of the crisis, there were hard realizations that thousands of businesses would not be able to sustain the stress of the pandemic, creating permanent paralysing gaps in production and supply chains. Governments would have to intervene with extraordinary relief measures and incentives. The pandemic would come to be a historic disrupter, and only those businesses and companies which were sustainable would be able to endure. In a Darwinian world, it really would come to ‘the survival of the fittest’, with changed rules of the game.
