25 LMT and cement by about 131 LMT. She also announced a reduction in performance security on contracts to provide relief to those in the construction and infrastructure sector and setting up of an infrastructure debt platform to provide project financing in the future. An amount of ₹10,200 crore was pumped in towards capital and industrial infrastructure for domestic defence equipment production, creation of industrial infrastructure and towards green energy initiatives. Finally, ₹900 crore were set aside for the Department of Biotechnology under 'Mission COVID Suraksha' for R&D of COVID-19 vaccines in India.[1] The ₹900 crore was further provided to five vaccine candidates in advanced stages of clinical development to help augment production facilities. Bharat Biotech and three public-sector manufacturers were provided grants under this to upgrade and purchase infrastructure and technology for vaccine production. Bharat Biotech was also given out a chunk of these funds to specifically enhance their production facility in Bangalore so that the company could roll out 10 crore doses per month by September 2021.

Speaking of vaccine development, never before has India incubated companies by engaging in proactive risk financing on a scale as enormous as this. The model of an 'entrepreneurial state' was envisioned by the prime minister and subsequently achieved with the prime objective to inoculate all Indians as soon as possible. Ever since Indian manufacturers had begun to show success in vaccine research, the project occupied a special place in his heart. He was determined to make the model a success, thus setting an example for decades to come, not just in vaccine research but in other important sectors as well. All in all, the prime minister placed his bet on India's domestic manufacturers versus yielding to pressure by international vaccine companies.

Not only had adequate financing been arranged, but the GoI also cleared roadblocks and were instrumental in strengthening end-to-end systems in vaccine development, manufacturing and distribution processes which are typically highly complex, multistage processes. For instance, 11 Good Clinical Practice (GCP)-compliant clinical trial sites had been established, with each site having access to a cohort of 50,000 to 1 lakh healthy volunteers who could be tracked for long periods of time in order to
