states other than Delhi because Delhi lapped up their share of oxygen due to error in calculation?

In the time of an unprecedented national crisis of this nature, many states stepped up to the challenge and made several positive alterations to keep lives safe. Some states like Andhra Pradesh and Telangana imported cryogenic tankers on a long-term lease, some like Maharashtra, Karnataka and Kerala put out oxygen audit reports to prevent wastage of oxygen, some like Odisha, which had surplus oxygen production,[79] went out of their way to send out oxygen to others and some like Kerala and Tamil Nadu[80] adopted a 'triage centre' model to direct patients to appropriate medical care so that those who didn't require oxygen wouldn't be unnecessarily put on it. But Delhi's response to a crippling second wave was absolutely underwhelming and complacent. One of their largest suppliers, Siddharth Jain, who ended up supplying 2,700 MT of oxygen at the peak, would later state in an interview,

> India manufactured 6,000 to 7,000 tonnes of product. In peak one, it required only 3,000. We believed we were good. Nobody expected this (rise in O2 demand) in such a short period of time. By the peak of the second wave India's requirement was at 9,000 tonnes. For a country to increase its oxygen production by 30%, in one month, is unprecedented. Oxygen is manufactured only in 70 locations across India but the consumption of oxygen happens in over 7000 places across the country. More than the production of oxygen, the supplying of oxygen was a major hurdle because in some cases, oxygen was being transported over 1,500 kilometres one way.

He added, 'This additional 2,000 tonnes a day that the country produced [in the peak of the second wave] has saved millions of people. It's difficult to put that into numbers, but we would have been in a very different place today.'[81]

Padma Shri awardee, Dr Devi Shetty said in an interview:

> I know a lot of people are criticizing the government, but I can tell you, the number of COVID patients we have, even if we present this to the US government, there is no way they can manage it … forget any other country. These are astronomical numbers that no country in the world has the infrastructure to manage. In terms of oxygen, I can tell you, I have gone through the details. Our government has
