what its original name was, although a number of theories have been put forward from the artifacts found in the area. One artifact mentions the name Kukkutarma, which translates to “City of the Cock”. This suggests that the city may have been famous for cock fighting or for breeding cocks.

Archaeological excavations show that the city was designed with streets laid at right angles with a complex drainage arrangement. Near the center of the site was a structure known as the Great Bath. It was heated and became one of the most famous buildings for those who lived here. Mohenjo-Daro was home to some exceptionally skillful workers who were able to use tin, copper, lead and bronze. The evidence is the statue of the Dancing Girl which is made from bronze. They were able to grow and cultivate cotton, peas, wheat, barley and sesame. The inhabitants of the city were mostly traders who brought goods from various other countries. There are ancient texts from Mesopotamia that may refer to India or Mohenjo-Daro by the name Meluhha or Magan. Furthermore, a number of artifacts that originated from the Indus Valley Civilization have been discovered at Mesopotamian sites.

We know from archaeological excavations that the people living in Harappa worshipped a variety of deities and practiced their own rituals. There are statues of numerous deities including the storm god Indra and terracotta statues of the Mother Goddess Shakti. Around 1,500 BCE, a new race known as the Aryans migrated into the country via the Khyber Pass and merged with the existing people. In addition to bringing their own deities with them, they were said to have introduced the use of horses to the area. The newcomers were nature worshippers or pantheists who worshipped the sun. It is unlikely that their gods had human qualities in contrast to the locals whose deities were anthropomorphic in nature.

It was also at this time (1,700 – 1,500 BCE) that Harappa seems to have suffered a deterioration in culture. Although scholars have put forth various theories, it is generally accepted that it was due to climate change. About nine meters of silt at Mohenjo-Daro suggests that the Indus River experienced many floods, which caused the people to abandon the cities here. However, the arrival of the Aryans is another popular theory for the
