Then add the .blue-hover CSS class to the button:

chapter_05/04/app/views/favorites/_list.html.erb

```
<button
  class="<%= SimpleForm.button_class %> blue-hover"
  data-controller="css-flip"
  data-css-flip-status-value="true"
  data-css-flip-off-class="is-closed"
  data-css-flip-on-class="is-open"
  data-action="click->css#toggle click->css-flip#toggle">
 <%= image_tag(
    "chevron-right.svg",
    width: 25,
    height: 25,
    class: "inline mb-3 slow-transition",
    "data-css-flip-target": "elementToChange"
  ) %>
</button>
```

With this change in place, when the mouse hovers over the button, the background color turns blue, and it does so with a gradual transformation over 0.5 seconds (which, admittedly, is a subtle effect). (Again, this could be done in pure Tailwind with transition duration-300 ease-in-out hover:bg-blue-500, and I'm choosing not to so that I can explain the general CSS behavior.)

We'd also like to have the actual item that we show and hide—all the concert information—gradually hide itself as well. This is a little bit harder. One of the first things you might think to try is to transition max-height from 100 percent to 0 percent. However, this doesn't work reliably because the max-height property changes if the width of the element changes, which I think means that if you resize the browser, the element won't transition correctly.

That said, if you have an explicitly set max-height that works, you can try it. Here's some CSS for the concerts part of the page:

chapter_05/05/app/assets/stylesheets/application.tailwind.css

```
.resizer {
  transition: all 1s ease-in-out;
```
