Rollup and webpack

The jsbundling-rails gem supports two other build tools right now, Rollup and webpack. They both do much the same thing as esbuild—package JavaScript for the browser based on a configuration you set up. webpack is the oldest and has the largest ecosystem. You might want to use it if you already have webpack or Webpacker code configured, but for systems like the ones we're discussing in this book, its complexity might be overkill. I honestly don't have much personal experience with Rollup. Like esbuild, it exists to be a simpler alternative to webpack. Rollup bills itself as being very good at minimizing the code that is sent to the browser, and it has plugins for TypeScript and JSX.
