```
      status: params[:status],
      user: params[status] == "held" ? current_user.id : nil
    )
    render(json: tickets.map(&:to_concert_h))
  end
end
```

And with that, the React code should work. You can verify this by opening the same concert page in two different browser windows. Click on one to purchase some tickets, and in the fullness of time, the other will update and display those changes.
