might have.

We use these assets with the same asset code that the Rails asset pipeline has used for several years:

chapter_01/02/app/views/layouts/application.html.erb

```
<!DOCTYPE html>
<html>
  <head>
    <title>North By North East</title>
    <meta name="viewport" content="width=device-width,initial-scale=1">
    <%= csrf_meta_tags %>
    <%= csp_meta_tag %>

    <%= stylesheet_link_tag "application", "data-turbo-track": "reload" %>
    <%= javascript_include_tag(
        "application",
        "data-turbo-track": "reload",
        defer: true
      ) %>
  </head>

  <body>
    <section class="py-12 px-6">
      <%= render "layouts/nav" %>
      <div class="container mx-auto">
        <div class="mt-6">
          <p class="notice"><%= notice %></p>
          <p class="alert"><%= alert %></p>
          <%= yield %>
        </div>
      </div>
    </section>
  </body>
</html>
```

The important lines here for our purposes are the stylesheet_link_tag and the javascript_include_tag, both of which will be converted to HTML that loads the files in app/assets/builds. We can add other tags here if we have multiple JavaScript manifests or CSS files. This is probably not necessary for JavaScript because the JavaScript file can itself include other files, but because we are using CSS and not
