Cypress-Rails, Databases, and You

One thing I noticed while using the cypress-rails gem is that the hook that is supposed to clear the database on exit doesn't always get executed, especially if you force quit out of the program somehow. In that case, you might get a database error on reload, when the cypress-rails gem tries to reapply the database seeds. When that happened to me, running `$ rails db:test:prepare` fixed the problem. I also found that I occasionally had to restart Postgres because force-quit Cypress might not return database connections correctly.

Also, note that in our current esbuild setup, if you make a change to the JavaScript code, you need to make sure `dev/build` is running or you need to run the `yarn build:js` task, otherwise Cypress won't see the new code when it creates its Rails server.
