Appendix 1

Framework Swap

You may look at the examples in the book and wonder if I deliberately or accidentally tuned the examples to show off Hotwire or React in a better light. Both examples have features that are there because they are particularly well suited to the tool being shown. The schedule page has the inline edits, for example, while the React page has the way that the entire page redraws available seats when the pull-down menu is changed.

I thought it’d be interesting to close out the book by showing what the React page looks like in Hotwire and vice versa. This lets you see each tool in a slightly different light and also exposes the fact that somehow the schedule page got significantly more complex than the concert ticket page.

My ground rules:

- I tried to mimic the functionality of the page as best I could in the other tool with one exception—I skipped the inline edit in the React schedule page. (More on that in a bit.)

- I also decided to swap the Hotwire app over to Import Maps so you could see what that looks like.

- I did not add any other new libraries that might have helped, though I was tempted to add an animation library to the React version of the schedule page.

- I realize that there are absolutely other ways of building these pages in the
