Converting JSX to ERB

I think the place to start here is to show the ERB files converted from the React. The structure is actually quite similar. Here's part of the concert show page itself:

appendix_hotwire/01/app/views/concerts/show.html.erb

```
<div class="concert">
  <%= render(@concert.venue, concert: @concert, user: current_user) %>
</div>
```

We're rendering the venue as its own object, meaning the partial is in app/views/venue/_venue.html.erb:

appendix_hotwire/01/app/views/venues/_venue.html.erb

```
<%= turbo_frame_tag(dom_id(venue)) do %>
  <section>
    <%= render("venues/subtotal", concert: concert, user: user) %>
    <%= render("venues/venue_header", concert: concert, venue: venue) %>
    <%= render(
          "venues/venue_body",
          venue: venue,
          user: user,
          concert: concert,
          tickets_to_buy_count: 1
        ) %>
  </section>
<% end %>
```

This venue is just splitting off into different partials, with basically the same breakdown as the React components had.

The subtotal partial has some Hotwire markup surrounding the "Clear Tickets" button:

appendix_hotwire/01/app/views/venues/_subtotal.html.erb

```
<%= turbo_frame_tag("subtotal_frame") do %>
  <section class="subtotal" id="subtotal">
    <div class="text-2xl font-bold mx-4">
```
