./bin/rails stimulus:manifest:update. There is also a generator, /bin/rails generate stimulus controllerName that will update the manifest and create a skeleton file for the new Stimulus controller.

If you are using importmap-rails, this load process will be different, and the installed application.js file will change yet again, see Appendix 1, *Framework Swap* for an example.

The default Hotwire install added a sample controller at app/javascript/controllers/hello_controller.js, which I have deleted.

Stimulus uses static class-level variables, which is a newer JavaScript feature that the JavaScript preprocessor needs to know about. This is all taken care of by esbuild, but you should look at the Stimulus installation instructions if you are bundling the JavaScript some other way.[34]

Okay, we're now ready to write some Stimulus code.
