

Plate 4.12 **Sunken Cake**

Plate 4.13 **Dry Cake**

Table 4.1 Common Faults in Selection of Ingredients for Preparation of Cakes

Possible causes	Effects
Flour a) Using too strong flour b) Too weak flour	Forms peak in center, tough and dry cakes May flatten out or sink, cause wet streak and may crumble.
Sugar a) Too large grain of sugar b) Too fine grain of sugar	Prevents entrapping of air cells and takes more time to dissolve. Dissolve quickly and leads to poor aeration.
Fat a) Granular fat b) Very hard fat c) Very soft fat	Has a poor creaming quality result in poor volume and coarse texture. Not cream up well Will not retain air while creaming
Eggs a) Too cold eggs b) Addition of too much egg at a time	 Fat will breakdown and affects aeration Improper mixing

4.1.4 Methods used for the preparation of cakes

The following methods are involved in the cream/butter cake and sponge cakes making processes:

1. Sugar batter method
2. Flour batter method or two–sponge method
3. Blending method
4. Boiled method
5. All–in–process method
6. Foaming method or sponge method
7. Sugar water method

These methods differ from one another by way of mixing, quantity of ingredients used, baking temperature and baking time.
