1. Sugar batter method

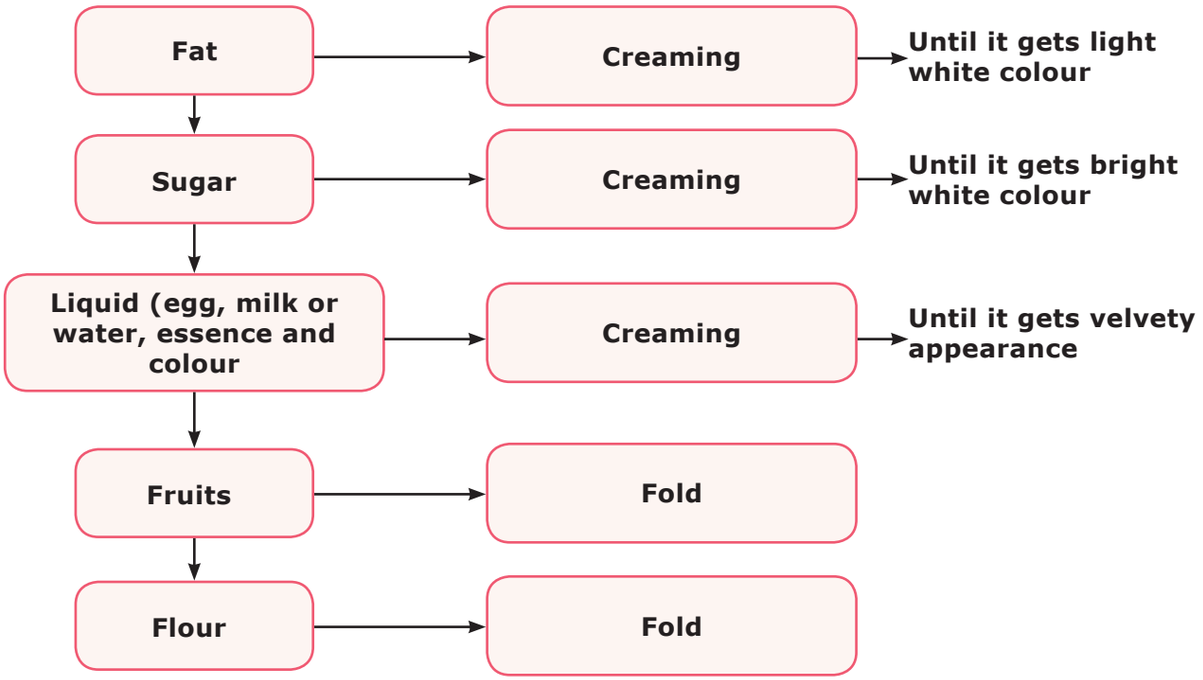

Figure 4.1 Sugar Batter Method

In sugar batter method, all the fat is creamed until it gets light white colour. Then sugar is added gradually continuing the creaming process. Do not add all the sugar at a time, it will affect the aeration process and will take more time to achieve the desired results. When adequate aeration is achieved, the fat and sugar mixture will be light and brighter in appearance. Then add beaten eggs gradually into mixture. Adding more eggs at a time will break the fat and sugar and the mixture will be coated by eggs. At that time the mixture will be like "curdle". It will affect the air incorporation.

After adding the eggs the batter will have a smooth light and velvety appearance. Other liquids can be added at this stage. This is done in order to have sufficient moisture in the mix, to prevent toughening of gluten, while mixing flour.

After mixing evenly, add sieved flour into the mixture. It is an important stage in cake making and even slight mishandling of the mixture will spoil the cake. Flour should not be added in one time, but it should be divided into two or three portions and each portion should not be added at a time and mixed with

DO YOU KNOW?

How to solve Curdling?

1. Add sufficient quantity of formula flour into the mixture. It will absorb the excess moisture and the batter will again become smooth.
2. The curdled mixture should be slightly warmed over a pot of warm water. The bowl should not touch the water. If it touches, the fat will melt or egg may coagulate.
