Feeding the world

India’s population had grown steadily since Independence, but the amount of food produced did not grow at the same pace. While in the US, Swaminathan had come into contact with a scientist named Norman Borlaug (who would go on to win the Nobel Peace Prize in 1970 for his work). Borlaug had developed a high-yielding and hardy dwarf variety of wheat that had been successfully grown in Mexico. Swaminathan invited Borlaug to come to India to see if this success could be replicated here. Following a fruitful visit and a successful test run, these seeds began to be distributed to farmers.
