Mumbai, and a network of partners in India to provide quality education and learning experiences at scale, directly to students and educators through the thoughtful blending of contemporary pedagogy and technology', Reif says.

The programme is being implemented in the states of Chhattisgarh, Mizoram, Rajasthan and Telangana. It will cover 'approximately 1,11,000 high school students and some 4,500 teachers in over 1,100 government schools'. The programme has particularly benefited schools in the state of Telangana in India where the government in 2022 partnered with TISS to strengthen the 'use of education technology, make school libraries active sites of learning; promote an inclusive culture in schools and improve the quality of in service and preservice teacher education'.

Ratan has also extended Tata Trusts' efforts to provide palliative care. In 2015, Tata Trusts pioneered a 'first-of-its-kind' Palliative Care Facility in India, 'in association with the Tata Memorial Centre in Kolkata', to provide 'relief to cancer patients in severe pain', to provide 'supportive care and relief during treatment, and [offer] end-of-life care and the required support to caregivers'. The centre set as its target catering to 'around 1,500 adults and 200 children and their families annually'.

In 2016, in partnership with Tata Trusts, the University of Chicago launched its new centre, the Tata Centre for Development (TCD), to focus on the various economic and social development challenges in India. With its main research areas including energy and environment, health and water and sanitation, TCD's research projects have already improved the quality of life in India. In 2017, its 'Star Ratings Programme' was launched by the government of Maharashtra to tackle air pollution.

The project was the 'world's first effort to scientifically evaluate whether mandatory public disclosures' could 'cause firms to reduce pollution'. In Tamil Nadu, TCD researchers also 'discovered that reminders sent through wearable devices' could 'nudge "high-risk" individuals to make smarter lifestyle choices, leading to improved health outcomes and lower medical costs'. Currently, TCD is working with the Tata Memorial Hospital to produce and test a low-cost saliva kit that would help in the early detection of oral cancer. On their part, the group and the Trusts have accorded priority to establishing cancer facilities in various Indian states, adopting a 'step-down' model to combating the dreaded disease.
