plug and spark is produced to ignite the air-fuel mixture in the combustion chamber.

10.2.1.2 (b) Rotating magnet type magneto ignition system

Construction

In this permanent magnet are fitted over the engine flywheel. The fixed armature will have few hundred winding (150 to 300 turns) made up of thick wire and this act as a primary winding. The secondary winding is made up of thin wire with thousands of turns (15000 to 25000 turns). Contact breaker points and condenser are connected to the primary winding and spark plug is connected in the secondary winding.

Working

When the flywheel is rotated, the permanent magnet will also rotate. This will make the flow of current to the primary winding and generates magnetic field. When the contact breaker points open, the magnetic field in the primary winding collapses and by mutual induction principle, high tension current is induced in the secondary winding. This high tension current is applied to the spark plug and spark is produced to ignite the air-fuel mixture in the combustion chamber.

10.2.1.3 Electronic ignition system

The following are the important parts of an Electronic Ignition System

1. Battery
2. Ignition Switch
3. Ignition Coil
4. Electronic Control Unit
5. Distributor
6. Spark Plug
7. Reluctor
