DO YOU KNOW?

One two-wheeler comes out of the production line every two seconds in India

The part which performs this action is called as the overdrive unit. If the main shaft in the gear box rotates at higher speed than the clutch shaft, then the transmission system is said to be with the over drive. Over drive unit is fixed next to the gear box. It is placed in between the gear box and the propeller shaft.

Construction

In over drive two shafts are present. They are input shaft and output shaft.
