to the nutrition of their patients. A modification in the diet can cure certain diseases. Numerous factors and conditions have the potential to impair patients' nutritional status.

Relationship of nutrition to health

Good nutrition leads to healthy living

4.3 DIFFERENCE BETWEEN BALANCED DIET AND MALNUTRITION

Balanced Diet

The term "Balanced Diet" refers to a diet that provides all of the nutrients body needs, without too much of any one component. A Balanced diet contains all types of food in a right proportion. It means a balanced diet contains the right amount of carbohydrate, protein, fat or oil, vitamins, mineral salts and water depending on the desired needs of the body.

A Balanced diet offers the full range of nutrients body needs to function at its peak performance level while an unbalanced diet is generally lacking in nutrients and too full of harmful ingredients.

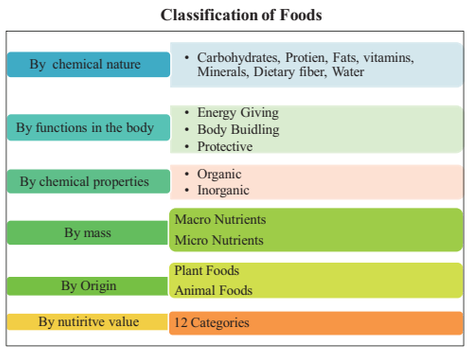

Malnutrition

Malnutrition is the eventual result of an imbalanced diet. Consuming too much or too little of any one nutrient, can cause malnutrition. Malnutrition can be so mild that a person suffers no ill effects. It can also be so severe that it causes serious illness or death. Malnutrition symptoms vary depending on the specific nutrient imbalance. Some possible symptoms include edema, chronic diarrhoea, anemia, goiter, weight loss and decreased muscle mass.

"The State of Food Security and Nutrition in the World, 2017" report suggested that 14.5% of the population is undernourished in India.

4.4 CLASSIFICATION OF FOOD

Food can be classified in accordance to their chemical property, to their function, to their essentiality, to their concentration and to their nutritive value.

a) According to the chemical nature

- carbohydrates
- proteins
- fats
- minerals
- vitamins
- dietary fiber
- water

b) According to their function in the body

Energy giving foods

The carbohydrates, fats and the protein are considered as calorie nutrients, so that the body can perform the necessary functions. Rice, chapatti, bread, potato, sugar, oil, butter and ghee are examples of energy giving foods.
