first few days the endometrium is reforming and it is termed as "Regenerative phase.". Estrogen stimulates proliferation and growth of endometrium. Under the control of oestrogen re-growth and thickening of endometrium begins. Ovulation occurs between day 12 and day 16.

c. **Secretary phase:** It lasts about 12 days. This phase is initiated response to increase in luteinizing hormone. Progesterone prepares the endometrium for pregnancy. The functional layer thickens to 3.5 mm and become spongy in appearance. The endometrium is vascular and rich in glycogen, spiral or coiled arteries develop. On day 27 and 28 oestrogen and progesterone levels fall because the corpus luteum is no longer producing them. Without these hormones, the uterine lining becomes ischemic. The lining starts to slough, the women has come to full cycle and it is once again at day first of the menstrual cycle.

Abnormalities in Menstruation

- Premenstrual Syndrome **(PMS).**
- PMS is any unpleasant or uncomfortable symptom during menstrual cycle that may temporarily disturb normal functioning. These symptoms may last from a few hours to many days.
- **Premenstrual Dysphoric Disorder (PMDD)** is a much more severe form of PMS which affects approximately 3%-8% of women of reproductive age. PMDD requires treatment by a physician.

FEMALE REPRODUCTIVE CYCLE
