9.9 EFFECTS OF DRUG ON BODY

Here we come across with Pharmacokinetics and Pharmacodynamics of the drug.

Pharmacokinetics – It describes the movement of the drug in our body, about its absorption, distribution, metabolism and excretion.

Pharmacodynamics – It describes about the mechanism of action of a drug at cellular, sub-cellular, and at molecular levels. The important principles of mechanism of action are stimulation, depression, replacement, irritation and cytotoxic action.

9.9.1 Adverse Drug Effects

Side effects: They are the unwanted but often unavoidable consequences of administered drug. E.g., aspirin produces gastric ulcer.

Toxic effects: They are due to over dosage or prolonged use. e.g., paracetamol causes hepatotoxicity..

Teratogenicity: It refers to the capacity of a drug to cause foetal abnormalities when administered to a pregnant mother. E.g., Tetracycline

Idiosyncrasy: It is a genetically determined abnormal reaction to a drug in an unusual manner. E.g., barbiturates.
