TYPES OF PHYSICAL RESTRAINTS

1. Mummy restraint
2. Elbow restraint
3. Extremity restraint
4. Abdominal restraint
5. Jacket restraint
6. Mitten or finger restraint

Mummy restraint

- It is a short-term type of restraint used on infants and small children during examinations and treatment of head and neck. It is used to immobilize the arms and legs of the child for a brief period of time

Elbow restraint

- This restraint is used to prevent flexion of the elbow and to hold the elbow in an extended position so that the infant cannot reach the face
- Plastic elbow restraint, elbow cuff and well padded wooden splint can also be used

Extremity restraint

- It is used to immobilize one or more extremities. One type of extremity restraint is clove-hitch restraint which is done with

gauze bandage strip (2 inches wide) making figure-of-eight and knot it

- The end of the gauze to be tied to the frame of the crib/bed
- This restraint should be used with padding of wrist or ankle
- Precautions to be taken to prevent tightening of the bandage

Abdominal restraint

- This restraint helps to hold the infant in a supine position on the Bed
